

JAVA PROGRAMMING FOR RASPBERRY PI - CSA0914 ASSIGNMENT - 4

P. Durga
192211195

Simple Inheritance

```
class Animal {  
    String name;  
    void makeSound();  
  
    System.out.print("Animal makes a sound");  
}
```

```
class Dog extends Animal {
```

@ Override

```
    void makeSound();
```

```
    System.out.print("The Dog bark");
```

```
}
```

```
public class main {
```

```
    public static void main (String[] args) {
```

```
        Dog dog = new Dog();
```

```
        dog.makeSound();  
    } }
```

Constructor Inheritance

```
class Person {
```

```
    String name;
```

```
    int age;
```

```
    Person (String name int age) {
```

```

        this.name = name;
        this.age = age;
class student extends person { string grade; student
student (string name, int age, string grade) {
    super (name, age)
    this.grade = grade; }
    void display () {
        student student = new student ("John", 20, "A");
        student.display ();
    }
}

```

Multilevel Inheritance:-

```

class vehicle {
    int speed;
    string fuelType;
    Vehicle (int speed, string fuel type) {
        this.speed = speed;
        this.fuel type = fuel type;
    }
class car extends vehicle {
    int number of Doors;
    car (int speed, string fuel type,

```

```
int number of Doors) {
```

```
    Super (speed, fuel type); }
```

```
public main {
```

```
    public static void main (String [] args) {
```

```
        electric car electric car = new electric(); display
```

```
        properties(); }
```

4) Method overriding in Inheritance

```
class shape {
```

```
    void draw() {
```

```
        System.out.print (" Drawing a shape "); }
```

```
class circle extends shape {
```

```
    @ override
```

```
    void draw() {
```

```
        System.out.print (" Drawing a circle "); }
```

```
public class main {
```

```
    public static void main (String [] args) {
```

```
        shape circle = new circle();
```

```
        circle.draw(); }
```

5) Inheritance and Access Modifiers:

```
class Employee {
```

```
    private String privateField = "private";
```

```
    protected String
```

```
        protectedField = "protected";
```

```
    public String publicField = "public"; }
```

```
class Manager extends Employee {
```

```
    void displayField() {
```

```
        System.out.print(privateField);
```

```
    }
```

```
public class Main {
```

```
    public static void main(String[] args) {
```

```
        Manager manager = new
```

```
            manager();
```

```
        manager.displayField();
```

```
    }
```
